

Wine Tracking

The Wine Tracking system is designed with the winemaking business in mind. It gives the user the freedom to either access the system through you local business network, or through the Internet, ensuring that you can still keep control of what is happening in the cellar while travelling locally or abroad.

The system allows you to track your wine making operation from vineyard blocks to cellar, right through to storage, bottling and labelling. The biggest asset of this system is its simplicity and the logical way in which it guides you through the wine making process.

You can create blocks and expected tonnage and litres per block and cultivar. You can also keep abreast of ageing vineyards on the farm, as well as what percentage of your productive land is covered with a particular cultivar.

Capture the arrival of grapes, track, and monitor the temperature and balling throughout the fermentation process. Track these trends over time, and print out graphs showing you what has happened per tank/barrel. Track additions anywhere in the process, while making sure you are adding the additions from the correct batch for traceability purposes. Draw reports on what additions were added to specific batch numbers in the system over time and when they were added.

Blend and move volumes to different storage areas without losing track of its origin. Manage your dry stock for the bottling and labelling process.

In short, the Wine Tracking system is an invaluable tool for monitoring and controlling the information and process of winemaking, both in the cellar or while off-site.
